

BBS Utilities (1.9)

Command-line utilities for the SBBS BBS software

Official support sites: [Official Github Repo](#) - [Official Forum](#)

Included Utilities:

- **bbs_announce** (1.1) - This posts a text file to the desired groups. It posts as content, not a attachment! The settings are in the file at the top. Especially note that you need to copy (and edit unless you want to promote my BBS ☺) the Announce.txt to /sbbs/exec.
- **perladd.pl** (1.18) - Scans the current folder for new files and adds them to your BBS's file area. Now has a option to enable you to add descriptions to your files at add-time.
- **file_announce** (1.2) - This posts a list of files that you have added using perladd.pl to the message base of your choice. It posts as content, not a attachment! The settings are in the file at the top. Especially note that you need to copy (and edit unless you want to promote my BBS ☺) the FilePost.txt & FilePostBottom.txt to /sbbs/exec. This version now handles long descriptions in the file list columns.
- **file_remove** (1.0) - This removes a file from your processed list so it can be imported with perladd.pl again.
- **updseen.pl** - Updates the perladd.pl /root/.seen file to fix issues - Not usually needed...

Basic Workflow

```
cd /source_dir
```

```
perladd.pl file_dir long <- this will prompt for file descriptions
```

```
repeat for each file to be added
```

```
file_announce.pl <- this will post all the entries for the previous files to your message base
```
